

Scalability & Future

Date	28 September 2026
Team ID	6ab221341
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	1 Mark

Project Overview

This document describes the implementation of Client Scripts and UI Policies for the Incident form in ServiceNow. Client Scripts are used to run client-side logic when users interact with the form, while UI Policies control the visibility, mandatory status, and read-only state of fields without requiring scripting for common form behavior.

Current System Limitations

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 1	Create and test Client Scripts for Incident form field behavior and validation.	Completed / Current	Improves data entry and form interaction.
Phase 2	Configure UI Policies to make selected fields mandatory, visible, or read-only based on conditions.	Next phase	Makes the form easier to use and reduces incomplete records.
Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 3	Test scenarios for different incident states, priorities, and user actions.	Future	Helps ensure consistent behavior and reduces errors.
Phase 4	Review user feedback and optimize scripts and policies as requirements evolve.	Future	Maintains performance and supports future enhancements.

Scalability Plan

S.No	Scalability Aspect	Current State	Proposed Upgrade / Solution
1	User Load	Incident form behavior is applied whenever users open or update incidents.	Use efficient, condition-based client scripts and avoid unnecessary client-side processing.
2	Data Storage	Incident records are stored in the ServiceNow Incident table.	Use appropriate fields and choices; keep data entry consistent through policies and validation.
3	Performance	Too many or overlapping client scripts can slow form interactions.	Keep scripts small, use appropriate onLoad/onChange/onSubmit events, and avoid duplicate logic.
4	Security	Client-side controls improve usability but are not a security boundary.	Enforce access and data protection with server-side ACLs and server-side validation where required.

Future Roadmap

S.No	Limitation	Impact	Priority
1	Required field behavior may not be consistently enforced on the Incident form.	Incomplete incident records may be submitted.	High
2	Field visibility and read-only behavior may depend on manual user actions.	Users may see irrelevant fields or edit fields that should be restricted.	Medium
3	Without clear client-side validation, incorrect or incomplete values may be entered.	More data-quality issues and extra correction work for support teams.	High

Note: The planned behavior and field conditions should be aligned with the actual Incident form configuration in the team's ServiceNow instance.
