

**Project Design Phase-II**  
**Technology Stack (Architecture & Stack)**

|               |                                                 |
|---------------|-------------------------------------------------|
| Date          | 28 September 2026                               |
| Team ID       | 6ab221341                                       |
| Project Name  | Implement Client Scripts & UI Policy (Incident) |
| Maximum Marks | 4 Marks                                         |

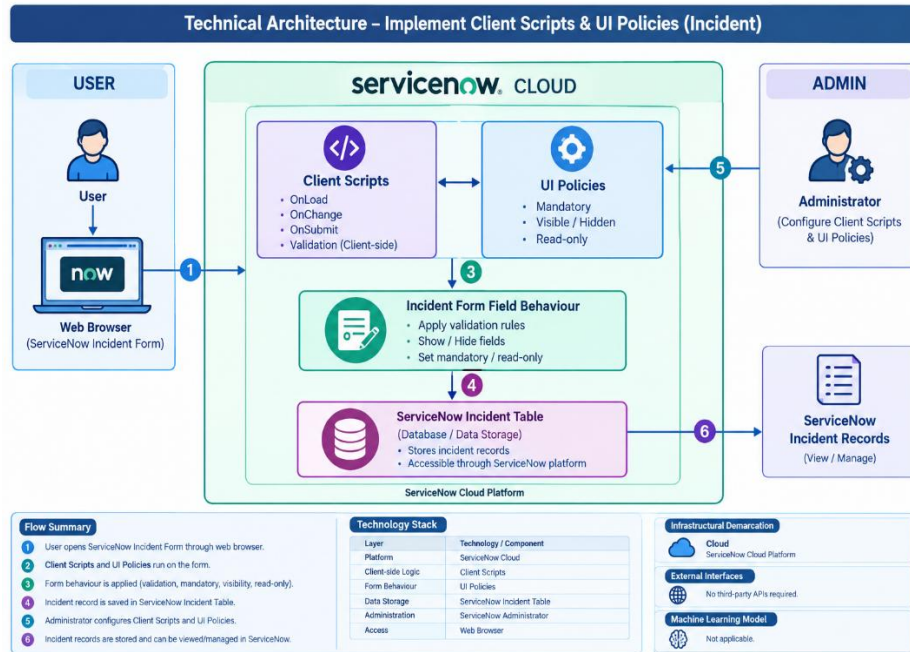

**Technical Architecture:**

The technical architecture of the proposed solution is based on the ServiceNow Cloud platform. The user accesses the ServiceNow Incident Form through a web browser. Client Scripts perform client-side validation and dynamic form actions, while UI Policies control field visibility, mandatory status, and read-only behaviour. The processed incident information is stored in the ServiceNow Incident Table. The Administrator configures and manages the Client Scripts and UI Policies.

**Example: ServiceNow Incident Management using Client Scripts and UI Policies**

### Guidelines:

- **Include all the processes:** Incident Form, Client Scripts, UI Policies, field validation, and incident record submission.
- **Provide infrastructural demarcation:** ServiceNow Cloud platform and web browser access.
- **Indicate external interfaces:** No third-party APIs or external interfaces are required.
- **Indicate Data Storage components / services:** ServiceNow Incident Table is used to store incident records.
- **Indicate interface to machine learning models:** Not applicable, as this project does not use any Machine Learning model.

**Table-1 : Components & Technologies:**

| S.No | Component           | Description                                                                    | Technology                            |
|------|---------------------|--------------------------------------------------------------------------------|---------------------------------------|
| 1    | User Interface      | User interacts with the ServiceNow Incident application through a web browser. | ServiceNow Incident Form, Web Browser |
| 2    | Application Logic-1 | Performs client-side validation and dynamic actions on the Incident form.      | Client Scripts                        |
| 3    | Application Logic-2 | Controls field visibility, mandatory status and read-only behaviour.           | UI Policies                           |

|    |                                 |                                                                             |                           |
|----|---------------------------------|-----------------------------------------------------------------------------|---------------------------|
| 4  | Application Logic-3             | Processes and manages incident records based on configured rules.           | ServiceNow Platform       |
| 5  | Database                        | Stores incident details and related information.                            | ServiceNow Incident Table |
| 6  | Cloud Database                  | Provides cloud-based data storage for the ServiceNow application.           | ServiceNow Cloud Database |
| 7  | File Storage                    | No separate file storage is required for the core project.                  | Not Applicable            |
| 8  | External API-1                  | No external API is required for the implementation.                         | Not Applicable            |
| 9  | External API-2                  | No external API is required for the implementation.                         | Not Applicable            |
| 10 | Machine Learning Model          | Machine Learning is not used in this project.                               | Not Applicable            |
| 11 | Infrastructure (Server / Cloud) | Application is deployed and accessed through the ServiceNow cloud platform. | ServiceNow Cloud          |

**Table-2: Application Characteristics:**

| S.No | Characteristics          | Description                                                                                          | Technology                   |
|------|--------------------------|------------------------------------------------------------------------------------------------------|------------------------------|
| 1    | Open-Source Frameworks   | No separate open-source framework is required; the project uses the ServiceNow platform.             | ServiceNow Platform          |
| 2    | Security Implementations | Access is controlled using ServiceNow users, roles and permissions.                                  | ServiceNow Access Controls   |
| 3    | Scalable Architecture    | Additional Client Scripts and UI Policies can be configured as requirements increase.                | ServiceNow Cloud             |
| 4    | Availability             | The application is available whenever the configured ServiceNow instance is available.               | ServiceNow Cloud             |
| 5    | Performance              | Client-side scripts and UI Policies provide quick validation and field updates on the Incident form. | Client Scripts & UI Policies |
